
Signal name	Effect when deasserted	Effect when asserted
RegDst	The register destination number for the Write register comes from the rt field (bits 20:16).	The register destination number for the Write register comes from the rd field (bits 15:11).
RegWrite	None.	The register on the Write register input is written with the value on the Write data input.
ALUSrc	The second ALU operand comes from the second register file output (Read data 2).	The second ALU operand is the sign-extended, lower 16 bits of the instruction.
PCSrc	The PC is replaced by the output of the adder that computes the value of PC + 4.	The PC is replaced by the output of the adder that computes the branch target.
MemRead	None.	Data memory contents designated by the address input are put on the Read data output.
MemWrite	None.	Data memory contents designated by the address input are replaced by the value on the Write data input.
MemtoReg	The value fed to the register Write data input comes from the ALU.	The value fed to the register Write data input comes from the data memory.

Control

- Selecting the operations to perform (ALU, read/write, etc.)
- Controlling the flow of data (multiplexor inputs)
- Information comes from the 32 bits of the instruction
- Example:

add $8, $17, $18 Instruction Format:

- ALU's operation based on instruction type and function code

Control

- e.g., what should the ALU do with this instruction
- Example: lw $1, 100($2)

35	2	1	100

op	rs	rt	16 bit offset

- ALU control input

```
0000   AND
0001   OR
0010   add
0110   subtract
0111   set-on-less-than
```

Control

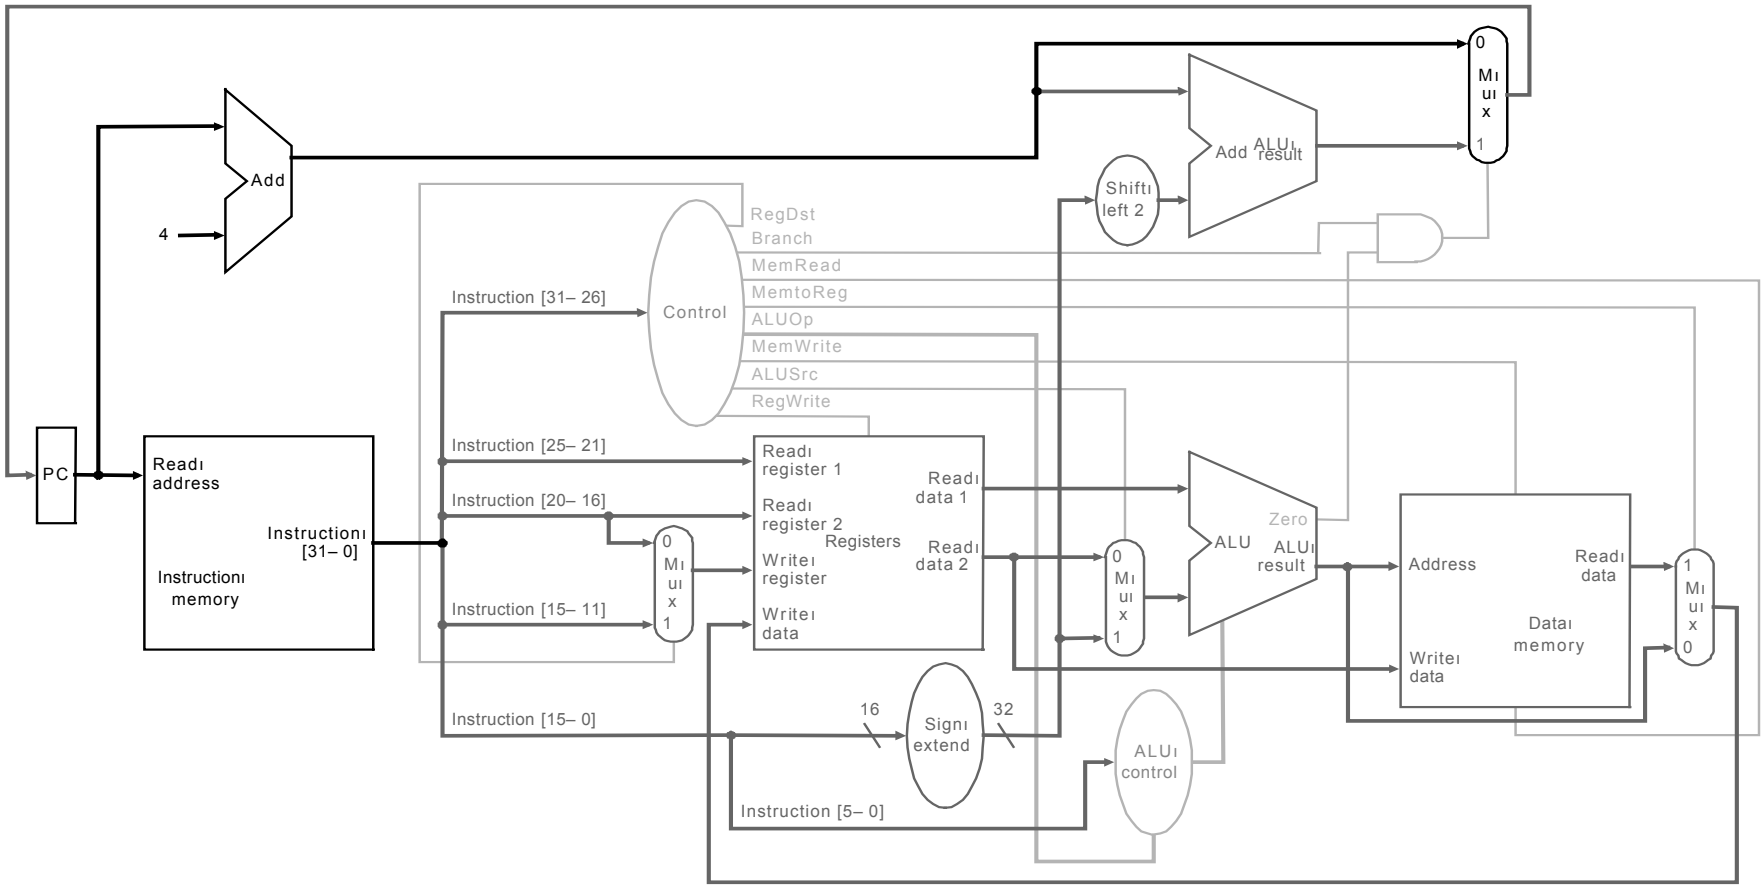
- **Must describe hardware to compute 4-bit ALU control input**
  - **given instruction type**

  - **function code for R-type**

- **Describe it using a truth table (can turn into gates):**

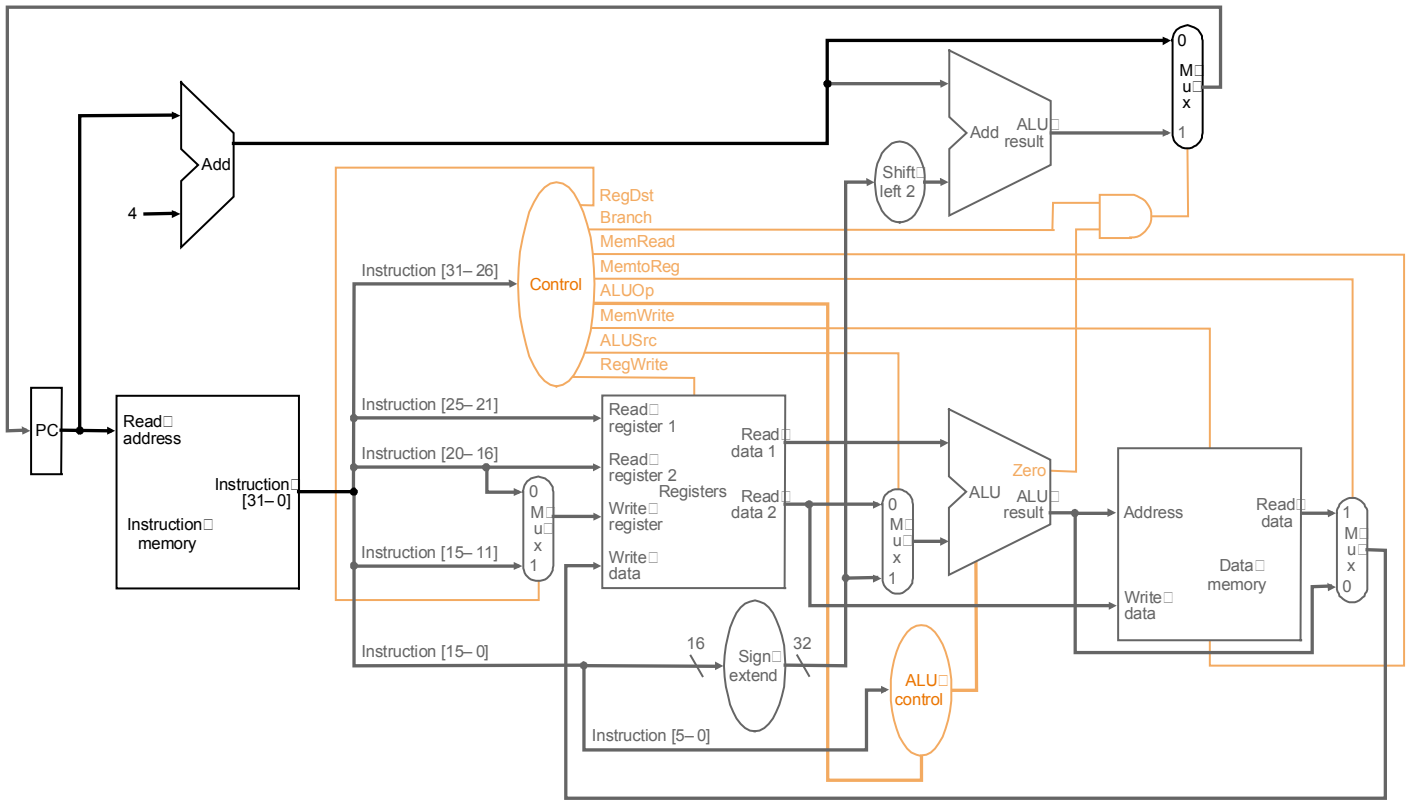
ALUOp		Funct field						Operation
ALUOp1	ALUOp0	F5	F4	F3	F2	F1	F0	
0	0	X	X	X	X	X	X	0010
0	1	X	X	X	X	X	X	0110
1	0	X	X	0	0	0	0	0010
1	0	X	X	0	0	1	0	0110
1	0	X	X	0	1	0	0	0000
1	0	X	X	0	1	0	1	0001
1	0	X	X	1	0	1	0	0111

Control



Instruction	RegDst	ALUSrc	Memto-Reg	Reg Write	Mem Read	Mem Write	Branch	ALUOp1	ALUp0
R-type	1	0	0	1	0	0	0	1	0
`lw`	0	1	1	1	1	0	0	0	0
`sw`	X	1	X	0	0	1	0	0	0
`beq`	X	0	X	0	0	0	1	0	1

Control

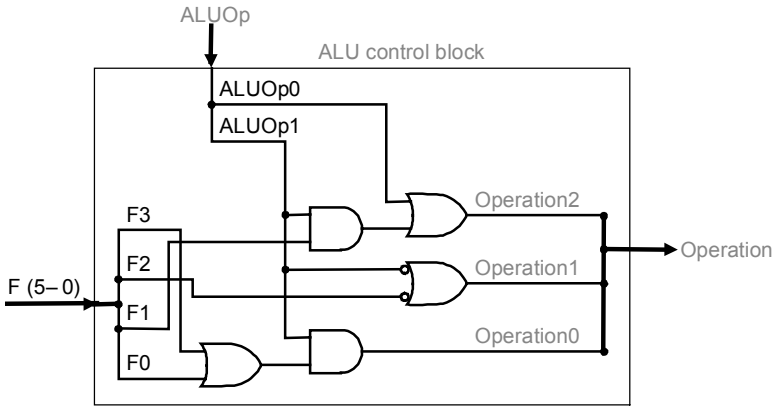


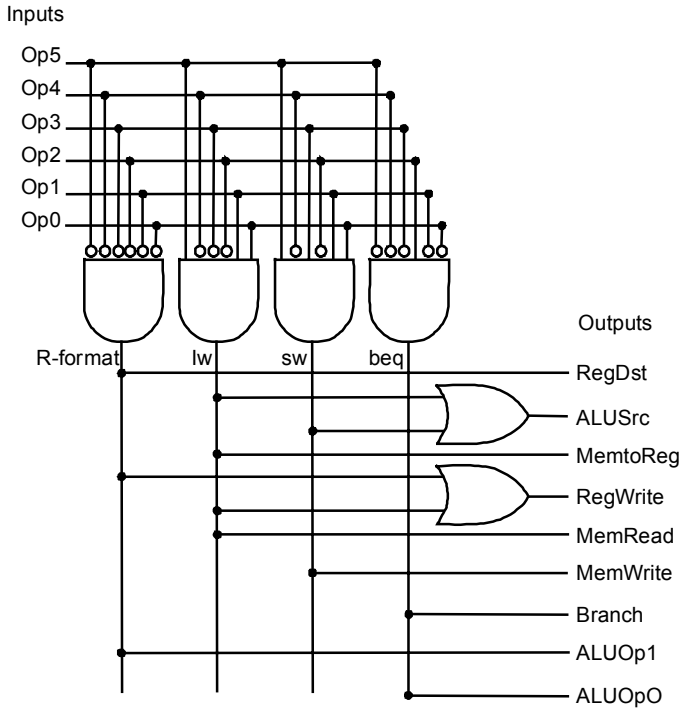
ALUOp		Funct field						Operation
ALUOp1	ALUOp0	F5	F4	F3	F2	F1	F0	
0	0	X	X	X	X	X	X	0010
0	1	X	X	X	X	X	X	0110
1	0	X	X	0	0	0	0	0010
1	0	X	X	0	0	1	0	0110
1	0	X	X	0	1	0	0	0000
1	0	X	X	0	1	0	1	0001
1	0	X	X	1	0	1	0	0111

Instruction	RegDst	ALUSrc	MemtoReg	RegWrite	MemRead	MemWrite	Branch	ALUOp1	ALUp0
R-format	1	0	0	1	0	0	0	1	0
lw	0	1	1	1	1	0	0	0	0
sw	X	1	X	0	0	1	0	0	0
beq	X	0	X	0	0	0	1	0	1

Control

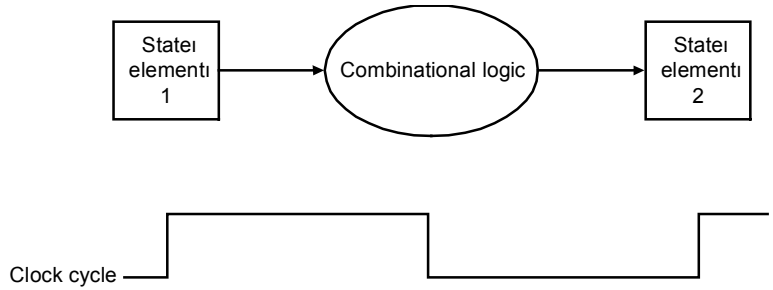
- **Simple combinational logic (truth tables)**





Our Simple Control Structure

- All of the logic is combinational
- We wait for everything to settle down, and the right thing to be done
  - ALU might not produce “right answer” right away
  - we use write signals along with clock to determine when to write
- Cycle time determined by length of the longest path



Single Cycle Implementation

- **Calculate cycle time assuming negligible delays except: memory (200ps), ALU and adders (200ps), register file access (100ps)**

Instr	Instr fetch	Register read	ALU op	Memory access	Register write	Total time
lw	200ps	100 ps	200ps	200ps	100 ps	800ps
sw	200ps	100 ps	200ps	200ps		700ps
R-format	200ps	100 ps	200ps		100 ps	600ps
beq	200ps	100 ps	200ps			500ps

Cycle time determined by length of the longest path = 800ps

Single Cycle Problems:

- **What if we had a more complicated instruction like floating point?**
- **Wasteful of area**

Solution:

- **Overlapping instructions (pipelining)**
